# Dana anywhere

Booking system integration

Our Dana anywhere concept allows integration with your booking system by the use of state of the art technologies. The integration supports integration with your booking system by sending messages via the HTTP protocol on a secure channel.

The integration allows a mapping between the rooms and the associated locks along with an electronic sharing of keys by e-mail, where the electronic keys can be permanently or temporary on a day-to-day basis.

Example:

The reception desk creates a reservation through the internal booking system.
The booking system sends a reservation request in to the Danaserver.
The Danaserver will share a time-restricted key to the respective customer.
